Galois Representations

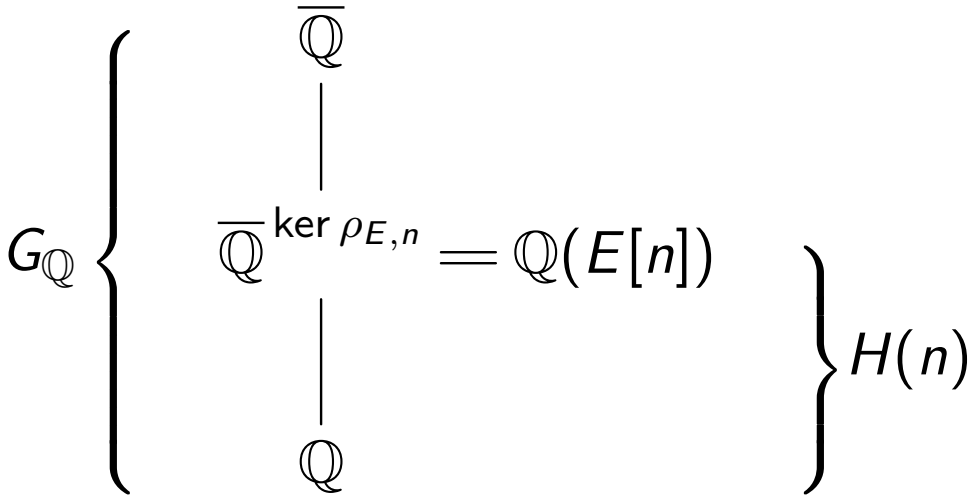
$$G_{\mathbb{Q}} := \mathrm{Aut}(\overline{\mathbb{Q}}/\mathbb{Q})$$

$$E[n](\overline{\mathbb{Q}}) \cong (\mathbb{Z}/n\mathbb{Z})^2$$

$$\begin{aligned}
\rho_{E,n}: \quad & G_{\mathbb{Q}} \to \mathrm{Aut}\, E[n] \quad \cong \quad \mathrm{GL}_2(\mathbb{Z}/n\mathbb{Z}) \\
\rho_{E,\ell^\infty}: \quad & G_{\mathbb{Q}} \to \mathrm{GL}_2(\mathbb{Z}_\ell) \quad = \quad \varprojlim_n \mathrm{GL}_2\left(\mathbb{Z}/\ell^n\mathbb{Z}\right) \\
\rho_{E}: \quad & G_{\mathbb{Q}} \to \mathrm{GL}_2(\widehat{\mathbb{Z}}) \quad = \quad \varprojlim_n \mathrm{GL}_2\left(\mathbb{Z}/n\mathbb{Z}\right)
\end{aligned}$$

Image of Galois

$$\rho_{E,n} \colon G_{\mathbb{Q}} \twoheadrightarrow H(n) \hookrightarrow \mathrm{GL}_2(\mathbb{Z}/n\mathbb{Z})$$



Problem (Mazur's "program B")

Classify all possibilities for $H(n)$.

Mazur's Program B

As presented at Modular functions in one variable V in Bonn

Theorem 1 also fits into a general program:

B. Given a number field K and a subgroup H of $GL_2\hat{\mathbb{Z}} = \prod_p GL_2\mathbb{Z}_p$ classify all elliptic curves $E_{/K}$ whose associated Galois representation on torsion points maps $\mathrm{Gal}(\overline{K}/K)$ into $H \subset GL_2\hat{\mathbb{Z}}$.

Mazur - Rational points on modular curves (1977)

Serre's Open Image Theorem

Theorem (Serre, 1972)

Let E be an elliptic curve over K without CM. The image of ρ_E

$$\rho_E(G_K) \subset \mathrm{GL}_2(\widehat{\mathbb{Z}})$$

is open.

Note:

$$\mathrm{GL}_2(\widehat{\mathbb{Z}}) \cong \prod_p \mathrm{GL}_2(\mathbb{Z}_p)$$

Example - torsion on an elliptic curve

If E has a K-rational **torsion point** $P \in E(K)[n]$ (of exact order n) then:

$$H(n) \subset \begin{pmatrix} 1 & * \\ 0 & * \end{pmatrix}$$

since for $\sigma \in G_K$ and $Q \in E(\overline{K})[n]$ such that $E(\overline{K})[n] \cong \langle P, Q \rangle$,

$$\begin{aligned} \sigma(P) &= P \\ \sigma(Q) &= a_\sigma P + b_\sigma Q \end{aligned}$$

Example - Isogenies

If E has a K-rational, **cyclic isogeny** $\phi\colon E \to E'$ with $\ker\phi = \langle P \rangle$ then:

$$H(n) \subset \begin{pmatrix} * & * \\ 0 & * \end{pmatrix}$$

since for $\sigma \in G_K$ and $Q \in E(\overline{K})[n]$ such that $E(\overline{K})[n] \cong \langle P, Q \rangle$,

$$\begin{aligned} \sigma(P) &= a_\sigma P \\ \sigma(Q) &= b_\sigma P + c_\sigma Q \end{aligned}$$

Example - other maximal subgroups

Normalizer of a split Cartan:

$$N_{\mathrm{sp}} = \left\langle \begin{pmatrix} * & 0 \\ 0 & * \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \right\rangle$$

$H(n) \subset N_{\mathrm{sp}}$ and $H(n) \not\subset C_{\mathrm{sp}}$ iff

- there exists an unordered pair $\{\phi_1, \phi_2\}$ of cyclic isogenies,
- whose kernels intersect trivially,
- neither of which is defined over K
- but which are both defined over some quadratic extension of K
- and which are Galois conjugate.

Modular curves

Definition

- $X(N)(K) := \{(E/K, P, Q) : E[N] = \langle P, Q \rangle\} \cup \{\text{cusps}\}$
- $X(N)(K) \ni (E/K, P, Q) \Leftrightarrow \rho_{E,N}(G_K) = \{I\}$

Definition

$\Gamma(N) \subset H \subset \mathrm{GL}_2(\widehat{\mathbb{Z}})$ (finite index)

- $X_H := X(N)/H$
- $X_H(K) \ni (E/K, \iota) \Leftrightarrow H(N) \subset H \mod N$

Stacky disclaimer

This is only true up to twist; there are some subtleties if

1. $j(E) \in \{0, 12^3\}$ (plus some minor group theoretic conditions), or
2. if $-I \in H$.

Rational Points on modular curves

Mazur's program B

Compute $X_H(\mathbb{Q})$ for all H.

Remark

- Sometimes $X_H \cong \mathbb{P}^1$ or elliptic with rank $X_H(\mathbb{Q}) > 0$.
- Some X_H have *sporadic* points.
- Can compute $g(X_H)$ group theoretically (via Riemann–Hurwitz).
- Can compute $\#X_H(\mathbb{F}_q)$ via moduli and enumeration [Sutherland].

Fact

$$g(X_H), \gamma(X_H) \to \infty \text{ as } \left[\mathrm{GL}_2(\widehat{\mathbb{Z}}) : H\right] \to \infty.$$

Sample subgroup (Serre)

$$\begin{array}{rcccl} \ker \phi_2 & \subset & H(8) & \subset & \mathrm{GL}_2(\mathbb{Z}/8\mathbb{Z}) \\ & & \downarrow{\scriptstyle \phi_2} & & \downarrow \\ I + 2M_2(\mathbb{Z}/2\mathbb{Z}) & \subset & H(4) & = & \mathrm{GL}_2(\mathbb{Z}/4\mathbb{Z}) \\ & & \downarrow{\scriptstyle \phi_1} & & \downarrow \\ & & H(2) & = & \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z}) \end{array}$$

$\dim_{\mathbb{F}_2} \ker \phi_2 = 3$

$\dim_{\mathbb{F}_2} \ker \phi_1 = 4$

$\chi\colon\ \mathrm{GL}_2(\mathbb{Z}/8\mathbb{Z}) \to \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z}) \times (\mathbb{Z}/8\mathbb{Z})^* \to \mathbb{Z}/2\mathbb{Z} \times (\mathbb{Z}/8\mathbb{Z})^* \cong \mathbb{F}_2^3.$

$\chi = \mathrm{sgn} \times \det$

$H(8) := \chi^{-1}(G),\ G \subset \mathbb{F}_2^3.$

A typical subgroup

$$
\begin{array}{ccccc}
\ker \phi_4 & \subset & H(32) & \subset & \mathrm{GL}_2(\mathbb{Z}/32\mathbb{Z}) \\
 & & \downarrow{\scriptstyle \phi_4} & & \downarrow \\
\ker \phi_3 & \subset & H(16) & \subset & \mathrm{GL}_2(\mathbb{Z}/16\mathbb{Z}) \\
 & & \downarrow{\scriptstyle \phi_3} & & \downarrow \\
\ker \phi_2 & \subset & H(8) & \subset & \mathrm{GL}_2(\mathbb{Z}/8\mathbb{Z}) \\
 & & \downarrow{\scriptstyle \phi_2} & & \downarrow \\
\ker \phi_1 & \subset & H(4) & \subset & \mathrm{GL}_2(\mathbb{Z}/4\mathbb{Z}) \\
 & & \downarrow{\scriptstyle \phi_1} & & \downarrow \\
 & & H(2) & = & \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z})
\end{array}
$$

$\dim_{\mathbb{F}_2} \ker \phi_4 = 4$

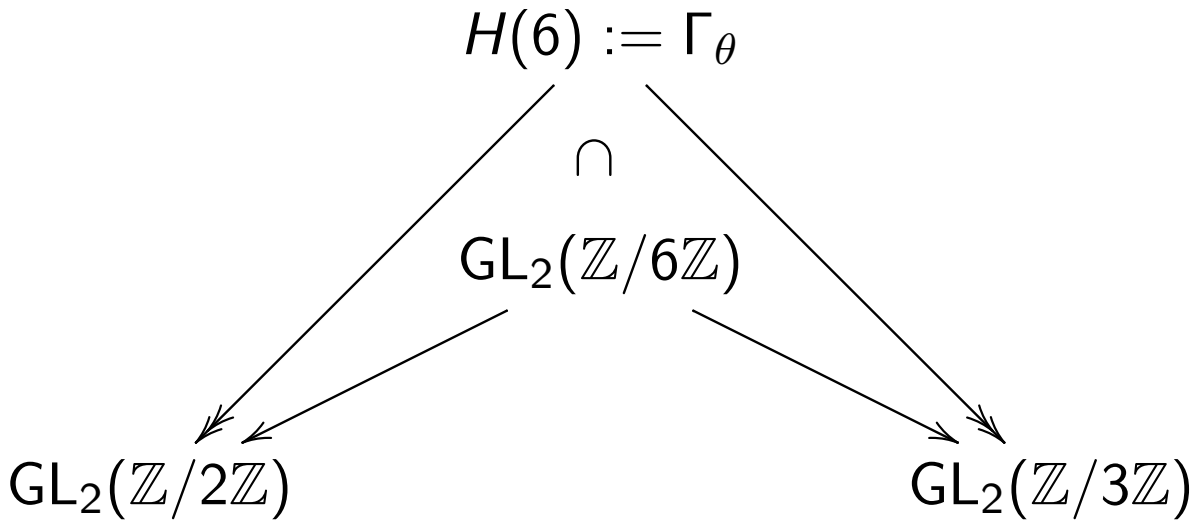
$\dim_{\mathbb{F}_2} \ker \phi_3 = 3$

$\dim_{\mathbb{F}_2} \ker \phi_2 = 2$

$\dim_{\mathbb{F}_2} \ker \phi_1 = 3$

Non-abelian entanglements

There exists a surjection $\theta\colon\ \mathrm{GL}_2(\mathbb{Z}/3\mathbb{Z}) \to \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z})$.



$$\mathrm{im}\,\rho_{E,6} \subset H(6) \Leftrightarrow j(E) = 2^{10}3^3t^3(1-4t^3) \Rightarrow K(E[2]) \subset K(E[3]).$$

$$X_H \cong \mathbb{P}^1 \xrightarrow{j} X(1).$$

Classification of Images - Mazur's Theorem

Theorem

Let E be an elliptic curve over $\mathbb{Q}$. Then for $\ell > 11$, $E(\mathbb{Q})[\ell] = \{0\}$.

In other words, for $\ell > 11$, $H(\ell)$ is not contained in a subgroup conjugate to

$$\begin{pmatrix} 1 & * \\ 0 & * \end{pmatrix}.$$

Classification of Images - Mazur; Bilu, Parent, Rebolledo

Theorem (Mazur)

Let E be an elliptic curve over $\mathbb{Q}$ without CM. Then for $\ell > 37$, $H(\ell)$ is not contained in a subgroup conjugate to

$$\begin{pmatrix} * & * \\ 0 & * \end{pmatrix}.$$

Theorem (Bilu, Parent, Rebolledo)

Let E be an elliptic curve over $\mathbb{Q}$ without CM. Then for $\ell > 13$, $H(\ell)$ is not contained in a subgroup conjugate to

$$\left\langle \begin{pmatrix} * & 0 \\ 0 & * \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \right\rangle.$$

Main conjecture

Conjecture (Serre)

Let E be an elliptic curve over $\mathbb{Q}$ without CM. Then for $\ell > 37$, $\rho_{E,\ell}$ is surjective.

In other words, conjecturally, $H(\ell) = \mathrm{GL}_2(\mathbb{Z}/\ell\mathbb{Z})$ for $\ell > 37$.

"Vertical" image conjecture

Conjecture

There exists a constant N such that for every $E/\mathbb{Q}$ without CM

$$\left[\mathrm{GL}_2(\widehat{\mathbb{Z}}) : \rho_E(G_{\mathbb{Q}})\right] \leq N.$$

Remark

This follows from the "$\ell > 37$" conjecture.

Problem

Assume the "$\ell > 37$" conjecture and compute N.

Main Theorem

Rouse, ZB (2-adic)

The index of $\rho_{E,2^\infty}(G_{\mathbb{Q}})$ divides 64 or 96; all such indices occur.

1. All indices dividing 96 occur infinitely often; 64 occurs only twice.
2. The 2-adic image is determined by the mod 32 image
3. 1208 different images can occur for non-CM elliptic curves
4. There are 8 "sporadic" subgroups.

Fun 2-adic facts

1. All indices dividing 96 occur infinitely often; 64 occurs only twice.
2. The 2-adic image is determined by the mod 32 image.
3. 1208 different images can occur for non-CM elliptic curves.
4. There are 8 "sporadic" subgroups.

More fun 2-adic facts

If $E/\mathbb{Q}$ is a non-CM elliptic curve whose mod 2 image has index

- 1, the 2-adic image can have index as large as 64;
- 2, the 2-adic image has index 2 or 4;
- 3, the 2-adic image can have index as large as 96;
- 6, the 2-adic image can have index as large as 96;
- (although some quadratic twist of E must have 2-adic image with index less than 96).

$j = -3 \cdot 2^{18} \cdot 5^3 \cdot 13^3 \cdot 41^3 \cdot 107^3 \cdot 17^{-16}$

$j = -2^{21} \cdot 3^3 \cdot 5^3 \cdot 7 \cdot 13^3 \cdot 23^3 \cdot 41^3 \cdot 179^3 \cdot 409^3 \cdot 79^{-16}$

Rational points on $X_{ns}^{+}(16)$ (Heegner, Baran)

Applications

Theorem (R. Jones, Rouse, ZB)

1. **Arithmetic dynamics**: *let* $P \in E(\mathbb{Q})$.
2. *How often is the order of* $\widetilde{P} \in E(\mathbb{F}_p)$ *odd?*
3. *Answer depends on* $\rho_{E,2^\infty}(G_\mathbb{Q})$.
4. *Examples:* $11/21$ *(generic),* $121/168$ *(maximal),* $1/28$ *(minimal)*

Theorem (Various authors)

Computation of $S_\mathbb{Q}(d)$ *for particular* d.

Theorem (Daniels, Lozano-Robledo, Najman, Sutherland)

Classification of $E(\mathbb{Q}(3^\infty))_{\text{tors}}$

Theorem (Gonzalez–Jimenez, Lozano–Robledo)

Classify $E/\mathbb{Q}$ *with* $\rho_{E,N}(G_\mathbb{Q})$ *abelian.*

More applications

Theorem (Sporadic points)

Najman's example $X_1(21)^{(3)}(\mathbb{Q})$; "easy production" of other examples.

Theorem (Jack Thorne)

Elliptic curves over $\mathbb{Q}_\infty$ are modular.
(One step is to show $X_0(15)(\mathbb{Q}_\infty) = X_0(15)(\mathbb{Q}) = \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/4\mathbb{Z}$.)

Recent theorems

Zywina (mod ℓ)

Classifies $\rho_{E,\ell}(G_{\mathbb{Q}})$ (modulo some conjectures).

Zywina (indices occuring infinitely often; modulo conjectures)

The **index** of $\rho_{E,N}(G_{\mathbb{Q}})$ divides $220, 336, 360, 504, 864, 1152, 1200, 1296$ or 1536.

Sutherland–Zywina

Parametrizations in all **prime power** levels, $g = 0$ and $g = 1, r > 0$ cases.

Brau–N. Jones, N. Jones–McMurdy (in progress)

Equations for X_H for entanglement groups H.

In progress

Morrow; Camacho–Li–Morrow–Petok–ZB (composite level)

Classifies $\rho_{E,\ell_1^n \cdot \ell_2^m}(G_{\mathbb{Q}})$ (partially).

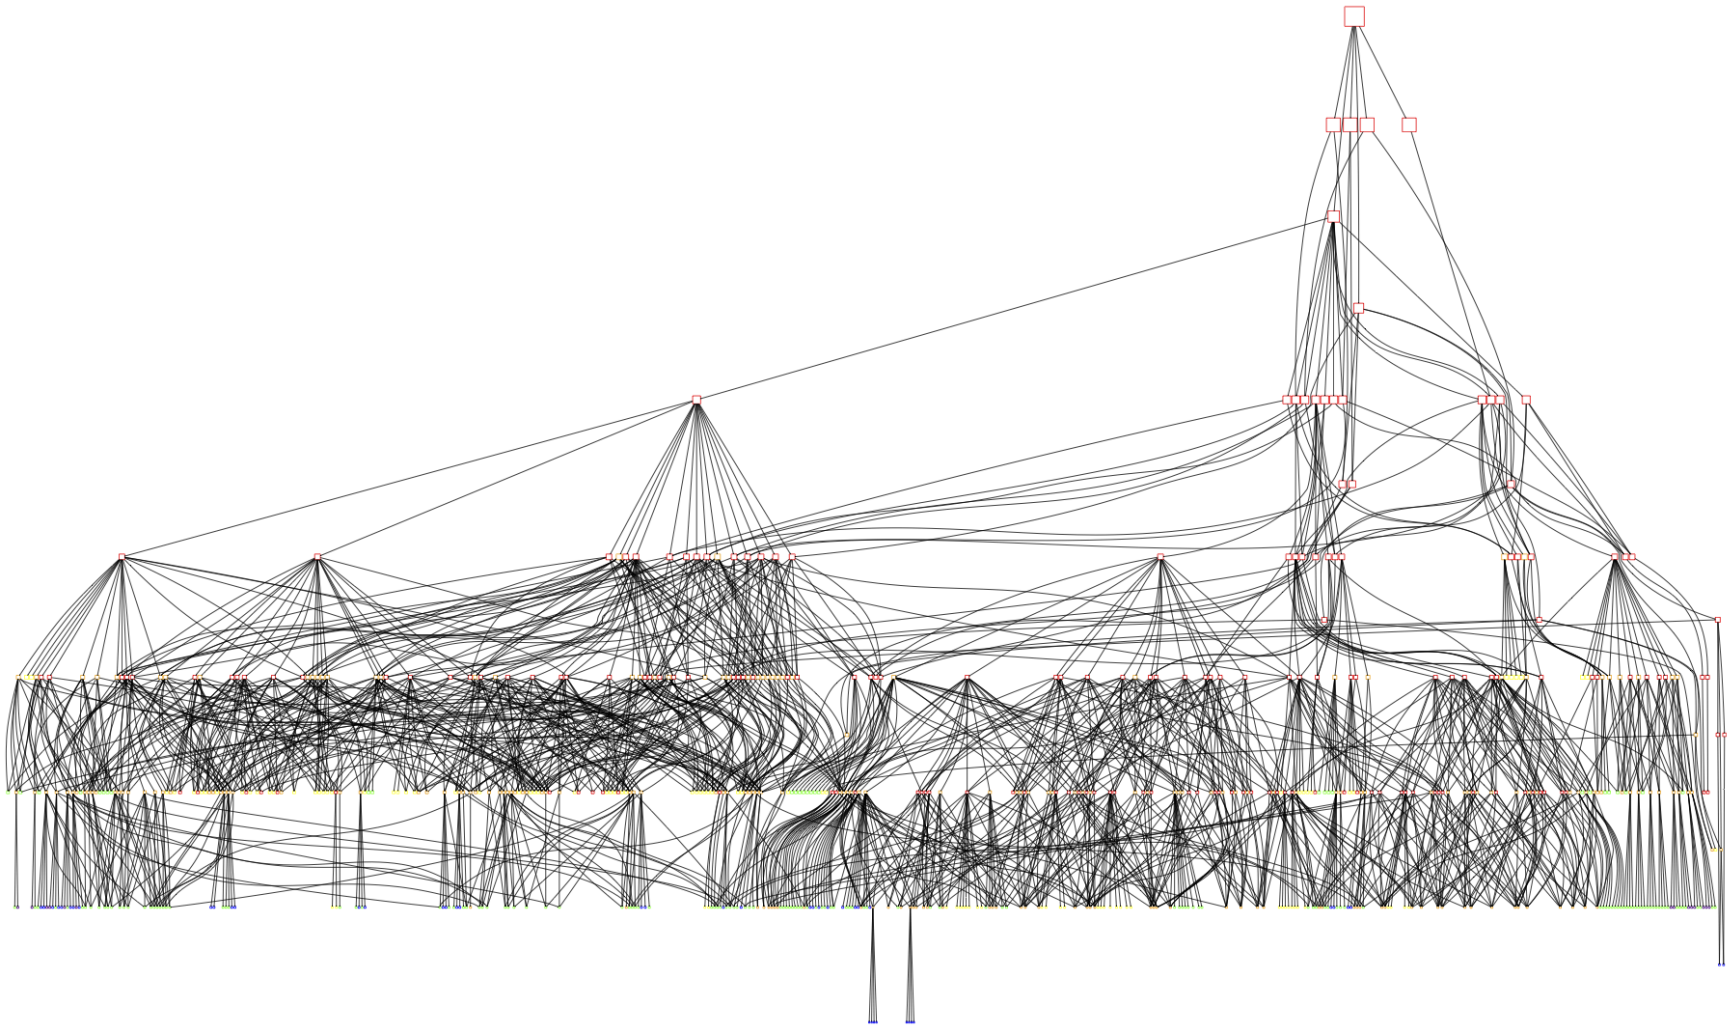
Derickx–Rouse–Sutherland–ZB for other prime powers (in progress)

Partial progress; e.g. for $N = 3^n$.

Proof template

1. Compute all arithmetically minimal $H \subset \mathrm{GL}_2(\mathbb{Z}_2)$
2. Compute equations for each X_H
3. Find (with proof) all rational points on each X_H.

Subgroups of $GL_2(\mathbb{Z}_2)$



Finding Equations – Basic idea

1. The canoncial map $C \hookrightarrow \mathbb{P}^{g-1}$ is given by $P \mapsto [\omega_1(P) : \cdots : \omega_g(P)]$.
2. For a general curve, this is an embedding, and the relations are quadratic.
3. For a modular curve,

$$M_k(H) \cong H^0(X_H, \Omega^1(\Delta)^{\otimes k/2})$$

given by

$$f(z) \mapsto f(z)\, dz^{\otimes k/2}.$$

Equations – Example: $X_1(17) \subset \mathbb{P}^4$

$$
\begin{aligned}
q - 11q^5 + 10q^7 + O(q^8) \\
q^2 - 7q^5 + 6q^7 + O(q^8) \\
q^3 - 4q^5 + 2q^7 + O(q^8) \\
q^4 - 2q^5 + O(q^8) \\
q^6 - 3q^7 + O(q^8)
\end{aligned}
$$

$$
\begin{aligned}
xu + 2xv - yz + yu - 3yv + z^2 - 4zu + 2u^2 + v^2 = 0 \\
xu + xv - yz + yu - 2yv + z^2 - 3zu + 2uv = 0 \\
2xz - 3xu + xv - 2y^2 + 3yz + 7yu - 4yv - 5z^2 - 3zu + 4zv = 0
\end{aligned}
$$

Equations – general

1. $H' \subset H$ of index 2, $X_{H'} \to X_H$ degree 2.
2. Given equations for X_H, compute equations for $X_{H'}$.
3. Compute a new modular form on H', compute (quadratic) relations between this and modular forms on H.
4. **Main technique** – if $X_{H'}$ has "new cusps", then write down Eisenstein series which vanish at "one new cusp, not others".

Rational points rundown, $\ell = 2$

318 curves (excluding pointless conics)

Genus	0	1	2	3	5	7
Number	175	52	56	18	20	4
Rank of Jacobian						
0		25	46	–	–	??
1		27	3	9	10	??
2			7	–	–	??
3				9	–	??
4					–	??
5					10	??

More 2-adic facts

1. There are 8 "sporadic" subgroups
   1. Only one genus 2 curve has a sporadic point
   2. Six genus 3 curves each have a single sporadic point
   3. The genus 1, 5, and 7 curves have no sporadic points
2. Many accidental isomorphisms of $X_H \cong X_{H'}$.
3. There is one H such that $g(X_H) = 1$ and $X_H \in X_H(\mathbb{Q})$.
