Galois Representations

$$\begin{aligned}\mathbb{Q} &\subset K \subset \overline{\mathbb{Q}} \\ G_K &:= \text{Aut}(\overline{K}/K) \\ E[n](\overline{K}) &\cong (\mathbb{Z}/n\mathbb{Z})^2\end{aligned}$$

$$\rho_{E,n}: G_K \rightarrow \text{Aut } E[n] \cong \text{GL}_2(\mathbb{Z}/n\mathbb{Z})$$

$$\rho_{E,\ell^\infty}: G_K \rightarrow \text{GL}_2(\mathbb{Z}_\ell) = \varprojlim_n \text{GL}_2(\mathbb{Z}/\ell^n\mathbb{Z})$$

$$\rho_E: G_K \rightarrow \text{GL}_2(\widehat{\mathbb{Z}}) = \varprojlim_n \text{GL}_2(\mathbb{Z}/n\mathbb{Z})$$

Serre's Open Image Theorem

Theorem (Serre, 1972)

Let E be an elliptic curve over K without CM. The image

$$\rho_E(G_K) \subset \mathrm{GL}_2(\widehat{\mathbb{Z}})$$

of ρ_E is open.

Note:

$$\mathrm{GL}_2(\widehat{\mathbb{Z}}) \cong \prod_{\ell} \mathrm{GL}_2(\mathbb{Z}_{\ell})$$

Thus $\rho_{E,\ell^{\infty}}$ is surjective for all but finitely many ℓ .

For CM curves, see Lozano-Robledo's [paper](#) and work by Bourdon, Clark, and Pollack.

Image of Galois

$$\rho_{E,n} : G_{\mathbb{Q}} \twoheadrightarrow H(n) \hookrightarrow \mathrm{GL}_2(\mathbb{Z}/n\mathbb{Z})$$

$$G_{\mathbb{Q}} \left\{ \begin{array}{c} \overline{\mathbb{Q}} \\ | \\ \overline{\mathbb{Q}}^{\ker \rho_{E,n}} = \mathbb{Q}(E[n]) \\ | \\ \mathbb{Q} \end{array} \right\} H(n)$$

Problem (Mazur's "program B")

Classify all possibilities for $H(n)$.

Mazur's Program B

As presented at Modular functions in one variable V in Bonn

Theorem 1 also fits into a general program:

B. Given a number field K and a subgroup H of $\widehat{\mathrm{GL}}_2 \mathbb{Z} = \prod_p \mathrm{GL}_2 \mathbb{Z}_p$ classify
all elliptic curves $E_{/K}$ whose associated Galois representation on torsion points
maps $\mathrm{Gal}(\bar{K}/K)$ into $H \subset \widehat{\mathrm{GL}}_2 \mathbb{Z}$.

Mazur - Rational points on modular curves (1977)

Example - torsion on an elliptic curve

If E has a K -rational **torsion point** $P \in E(K)[n]$ (of exact order n) then:

$$H(n) \subset \begin{pmatrix} 1 & * \\ 0 & * \end{pmatrix}$$

since for $\sigma \in G_K$ and $Q \in E(\overline{K})[n]$ such that $E(\overline{K})[n] \cong \langle P, Q \rangle$,

$$\begin{aligned}\sigma(P) &= P \\ \sigma(Q) &= a_\sigma P + b_\sigma Q\end{aligned}$$

Example - Isogenies

If E has a K -rational, **cyclic isogeny** $\phi: E \rightarrow E'$ with $\ker \phi = \langle P \rangle$ then:

$$H(n) \subset \begin{pmatrix} * & * \\ 0 & * \end{pmatrix}$$

since for $\sigma \in G_K$ and $Q \in E(\overline{K})[n]$ such that $E(\overline{K})[n] \cong \langle P, Q \rangle$,

$$\begin{aligned}\sigma(P) &= a_\sigma P \\ \sigma(Q) &= b_\sigma P + c_\sigma Q\end{aligned}$$

Example - other maximal subgroups

Normalizer of a split Cartan:

$$N_{\text{sp}} = \left\langle \begin{pmatrix} * & 0 \\ 0 & * \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \right\rangle$$

$H(n) \subset N_{\text{sp}}$ and $H(n) \not\subset C_{\text{sp}}$ iff

- there exists an unordered pair $\{\phi_1, \phi_2\}$ of cyclic isogenies,
- whose kernels intersect trivially,
- neither of which is defined over K ,
- but which are both defined over some quadratic extension of K ,
- and which are Galois conjugate.

Example - other maximal subgroups

$\mathbb{F}_{p^2}^*$ acts on $\mathbb{F}_{p^2} \cong \mathbb{F}_p \times \mathbb{F}_p$

Normalizer of a non-split Cartan:

$$C_{\text{ns}} = \text{im} \left(\mathbb{F}_{p^2}^* \rightarrow \text{GL}_2(\mathbb{F}_p) \right) \subset N_{\text{ns}}$$

$H(n) \subset N_{\text{ns}}$ and $H(n) \not\subset C_{\text{ns}}$ iff

E admits a “necklace” (Rebolledo, Wuthrich)

Image of Galois

$$\rho_{E,n} : G_{\mathbb{Q}} \twoheadrightarrow H(n) \hookrightarrow \mathrm{GL}_2(\mathbb{Z}/n\mathbb{Z})$$

$$G_{\mathbb{Q}} \left\{ \begin{array}{c} \overline{\mathbb{Q}} \\ | \\ \overline{\mathbb{Q}}^{\ker \rho_{E,n}} = \mathbb{Q}(E[n]) \\ | \\ \mathbb{Q} \end{array} \right\} H(n)$$

Problem (Mazur's "program B")

Classify all possibilities for $H(n)$.

Modular curves

Definition

- $X(N)(K) := \{(E/K, P, Q) : E[N] = \langle P, Q \rangle\} \cup \{\text{cusps}\}$
- $X(N)(K) \ni (E/K, P, Q) \Leftrightarrow \rho_{E,N}(G_K) = \{I\}$

Let $\Gamma(N) \subset H \subset \mathrm{GL}_2(\widehat{\mathbb{Z}})$. The minimal such N is the **level** of H .

Definition

$X_H := X(N)/H(N)$ (where $H(N)$ is the image of H in $\mathrm{GL}_2(\mathbb{Z}/N\mathbb{Z})$)

$X_H(K) \ni (E/K, \iota) \Leftrightarrow \rho_{E,N}(G_K) \subset H(N)$

Stacky disclaimer

This is only true up to twist; there are some subtleties if

- ① $j(E) \in \{0, 12^3\}$ (plus some minor group theoretic conditions), or
- ② if $-I \in H$.

Rational Points on modular curves

Mazur's program B

Compute $X_H(\mathbb{Q})$ for all H .

Remark

- Sometimes $X_H \cong \mathbb{P}^1$ or elliptic with $\text{rank } X_H(\mathbb{Q}) > 0$.
- Some X_H have **exceptional** points (i.e, non-cusp non-CM points).
- Can compute $g(X_H)$ group theoretically (via Riemann–Hurwitz).

Fact

$$g(X_H), \gamma(X_H) \rightarrow \infty \text{ as } [\mathrm{GL}_2(\widehat{\mathbb{Z}}) : H] \rightarrow \infty.$$

(Serre) Sample subgroup $H \subset \mathrm{GL}_2(\widehat{\mathbb{Z}})$

$$\begin{array}{ccccccc} \ker \phi_2 & \subset & H(8) & \subset & \mathrm{GL}_2(\mathbb{Z}/8\mathbb{Z}) & & \dim_{\mathbb{F}_2} \ker \phi_2 = 3 \\ & & \downarrow \phi_2 & & \downarrow & & \\ I + 2M_2(\mathbb{Z}/2\mathbb{Z}) & \subset & H(4) & = & \mathrm{GL}_2(\mathbb{Z}/4\mathbb{Z}) & & \dim_{\mathbb{F}_2} \ker \phi_1 = 4 \\ & & \downarrow \phi_1 & & \downarrow & & \\ & & H(2) & = & \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z}) & & \end{array}$$

$$\chi: \mathrm{GL}_2(\mathbb{Z}/8\mathbb{Z}) \rightarrow \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z}) \times (\mathbb{Z}/8\mathbb{Z})^* \rightarrow \mathbb{Z}/2\mathbb{Z} \times (\mathbb{Z}/8\mathbb{Z})^* \cong \mathbb{F}_2^3.$$

$$\chi = \mathbf{sgn} \times \det$$

$$H(8) := \chi^{-1}(G), G \subset \mathbb{F}_2^3.$$

A typical subgroup $H \subset \mathrm{GL}_2(\widehat{\mathbb{Z}})$

$$\begin{array}{ccccccc} \ker \phi_4 & \subset & H(32) & \subset & \mathrm{GL}_2(\mathbb{Z}/32\mathbb{Z}) & & \dim_{\mathbb{F}_2} \ker \phi_4 = 4 \\ & & \downarrow \phi_4 & & \downarrow & & \\ \ker \phi_3 & \subset & H(16) & \subset & \mathrm{GL}_2(\mathbb{Z}/16\mathbb{Z}) & & \dim_{\mathbb{F}_2} \ker \phi_3 = 3 \\ & & \downarrow \phi_3 & & \downarrow & & \\ \ker \phi_2 & \subset & H(8) & \subset & \mathrm{GL}_2(\mathbb{Z}/8\mathbb{Z}) & & \dim_{\mathbb{F}_2} \ker \phi_2 = 2 \\ & & \downarrow \phi_2 & & \downarrow & & \\ \ker \phi_1 & \subset & H(4) & \subset & \mathrm{GL}_2(\mathbb{Z}/4\mathbb{Z}) & & \dim_{\mathbb{F}_2} \ker \phi_1 = 3 \\ & & \downarrow \phi_1 & & \downarrow & & \\ H(2) & = & & & \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z}) & & \end{array}$$

Non-abelian entanglements

There exists a surjection $\theta: \mathrm{GL}_2(\mathbb{Z}/3\mathbb{Z}) \rightarrow \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z})$.

$$\begin{array}{ccc} H(6) := \Gamma_\theta & \cap & \\ \swarrow & & \searrow \\ \mathrm{GL}_2(\mathbb{Z}/6\mathbb{Z}) & & \\ \nwarrow & & \searrow \\ \mathrm{GL}_2(\mathbb{Z}/2\mathbb{Z}) & & \mathrm{GL}_2(\mathbb{Z}/3\mathbb{Z}) \end{array}$$

Brau–Jones

$$\begin{aligned} \mathrm{im} \rho_{E,6} \subset H(6) \Leftrightarrow j(E) = 2^{10}3^3t^3(1-4t^3) \Rightarrow K(E[2]) \subset K(E[3]) \\ X_H \cong \mathbb{P}^1 \xrightarrow{j} X(1) \end{aligned}$$

Main conjecture

Conjecture (Serre)

Let E be an elliptic curve over \mathbb{Q} without CM. Then for $\ell > 37$, $\rho_{E,\ell}$ is surjective.

In other words, conjecturally, $\rho_{E,\ell^\infty} = \mathrm{GL}_2(\mathbb{Z}_\ell)$ for $\ell > 37$.

“Vertical” image conjecture

Conjecture

There exists a constant N such that for every E/\mathbb{Q} without CM

$$\left[\mathrm{GL}_2(\widehat{\mathbb{Z}}) : \rho_E(G_{\mathbb{Q}}) \right] \leq N.$$

Remark

This follows from the “ $\ell > 37$ ” conjecture.

Problem

Assume the “ $\ell > 37$ ” conjecture and compute N .

Labeling subgroups of $\mathrm{GL}_2(\widehat{\mathbb{Z}})$ up to conjugacy

Definition

When $\det(H) = \widehat{\mathbb{Z}}^\times$ these labels have the form $N.i.g.n$, where N is the level, i is the index, g is the genus, and n is a tiebreaker given by ordering the subgroups of $\mathrm{GL}_2(N)$.

Example

- The Borel subgroup $B(13)$ has label $13.14.0.1$.
- The normalizer of the split Cartan $N_{\mathrm{sp}}(13)$ has label $13.91.3.1$.
- The normalizer of the nonsplit Cartan $N_{\mathrm{ns}}(13)$ has label $13.78.3.1$.
- The maximal S_4 exceptional group $S_4(13)$ has label $13.91.3.2$.

Main Theorem

Definition

A point $(E, \iota) \in X_H(K)$ is **exceptional** if $X_H(K)$ is finite and $\text{End } E = \mathbb{Z}$.

Theorem (Rouse–Sutherland–ZB 2021)

Let ℓ prime, E/\mathbb{Q} be a non-CM elliptic curve, and $H = \rho_{E,\ell^\infty}(G_\mathbb{Q})$.

Then exactly one of the following is true:

- ① $X_H(\mathbb{Q})$ is infinite and H is listed in (Sutherland–Zywina 2017);
- ② X_H has a rational exceptional point listed in Table 1;
- ③ $H \leq N_{\text{ns}}(3^3), N_{\text{ns}}(5^2), N_{\text{ns}}(7^2), N_{\text{ns}}(11^2)$, or $N_{\text{ns}}(\ell)$ for some $\ell > 13$;
- ④ H is a subgroup of 49.179.9.1 or 49.196.9.1.

We conjecture that cases (3) and (4) never occur.

If they do, the exceptional points have **extraordinarily** large heights (e.g. $10^{10^{200}}$ for $X_{\text{ns}}^+(11^2)(\mathbb{Q})$).

Summary of $H \leq \mathrm{GL}_2(\mathbb{Z}_\ell)$ which occur as $\rho_{E,\ell^\infty}(G_\mathbb{Q})$ for some non-CM E/\mathbb{Q} .

Starred primes are conjectural.

In particular, we conjecture that there are 1207, 46, 24, 16, 7, 11, 2, 2 proper subgroups of $\mathrm{GL}_2(\mathbb{Z}_\ell)$ that arise as $\rho_{E,\ell^\infty}(G_\mathbb{Q})$ for non-CM E/\mathbb{Q} for $\ell = 2, 3, 5, 7, 11, 13, 17, 37$ and none for any other ℓ .

Applications

Theorem (R. Jones, Rouse, ZB)

- ① **Arithmetic dynamics:** let $P \in E(\mathbb{Q})$.
- ② How often is the order of $\tilde{P} \in E(\mathbb{F}_p)$ odd?
- ③ Answer depends on $\rho_{E,2^\infty}(G_{\mathbb{Q}})$.
- ④ Examples: 11/21 (generic), 121/168 (maximal), 1/28 (minimal)

Theorem (Daniels, Lozano-Robledo, Najman, Sutherland)

Classification of $E(\mathbb{Q}(3^\infty))_{tors}$

Theorem (Gonzalez-Jimenez, Lozanon-Robledo)

Classify E/\mathbb{Q} with $\rho_{E,N}(G_{\mathbb{Q}})$ abelian.

Theorem (Rouse–Sutherland–ZB)

Improved algorithms for computing $\rho_{E,n}(G_{\mathbb{Q}})$.

Arithmetically maximal groups

Definition

We say that an open subgroup $H \subseteq \mathrm{GL}_2(\widehat{\mathbb{Z}})$ is **arithmetically maximal** if

- ① $\det(H) = \widehat{\mathbb{Z}}^\times$ (necessary for \mathbb{Q} -points),
- ② a conjugate of $\begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$ or $\begin{pmatrix} 1 & 1 \\ 0 & -1 \end{pmatrix}$ lies in H (necessary for \mathbb{R} -points),
- ③ $j(X_H(\mathbb{Q}))$ is finite but $j(X_{H'}(\mathbb{Q}))$ is infinite for $H \subsetneq H' \subseteq \mathrm{GL}_2(\widehat{\mathbb{Z}})$.

Arithmetically maximal groups H arise as maximal subgroups of an H' with $X_{H'}(\mathbb{Q})$ infinite.

Arithmetically maximal groups

Definition

We say that an open subgroup $H \subseteq \mathrm{GL}_2(\widehat{\mathbb{Z}})$ is **arithmetically maximal** if

- ① $\det(H) = \widehat{\mathbb{Z}}^\times$ (necessary for \mathbb{Q} -points),
- ② a conjugate of $\begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$ or $\begin{pmatrix} 1 & 1 \\ 0 & -1 \end{pmatrix}$ lies in H (necessary for \mathbb{R} -points),
- ③ $j(X_H(\mathbb{Q}))$ is finite but $j(X_{H'}(\mathbb{Q}))$ is infinite for $H \subsetneq H' \subseteq \mathrm{GL}_2(\widehat{\mathbb{Z}})$.

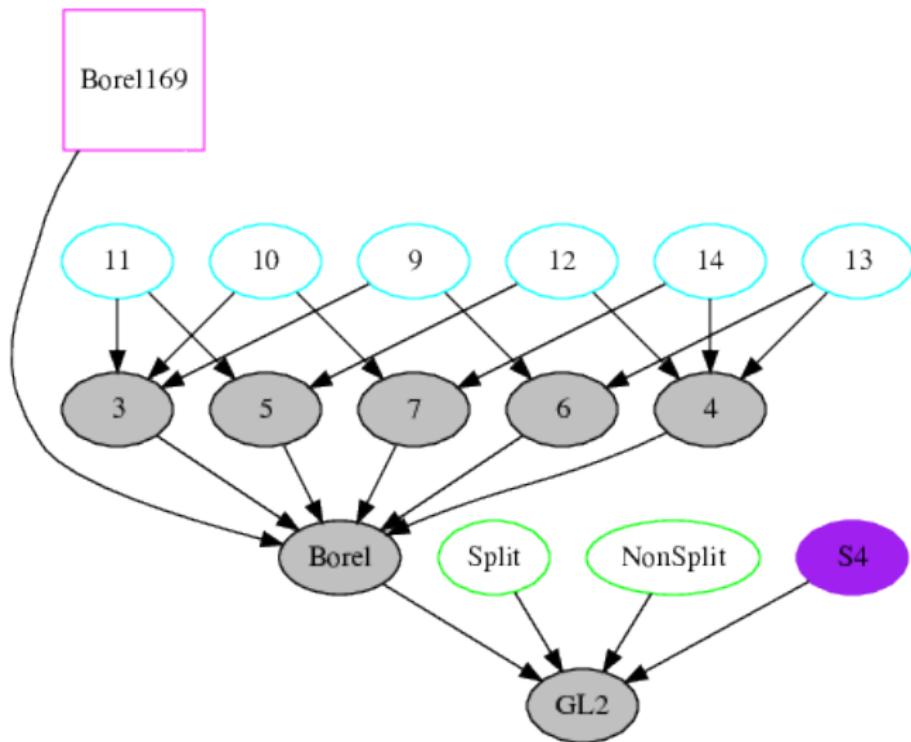

Arithmetically maximal groups H arise as maximal subgroups of an H' with $X_{H'}(\mathbb{Q})$ infinite.

Theorem (Sutherland–Zywina 2017)

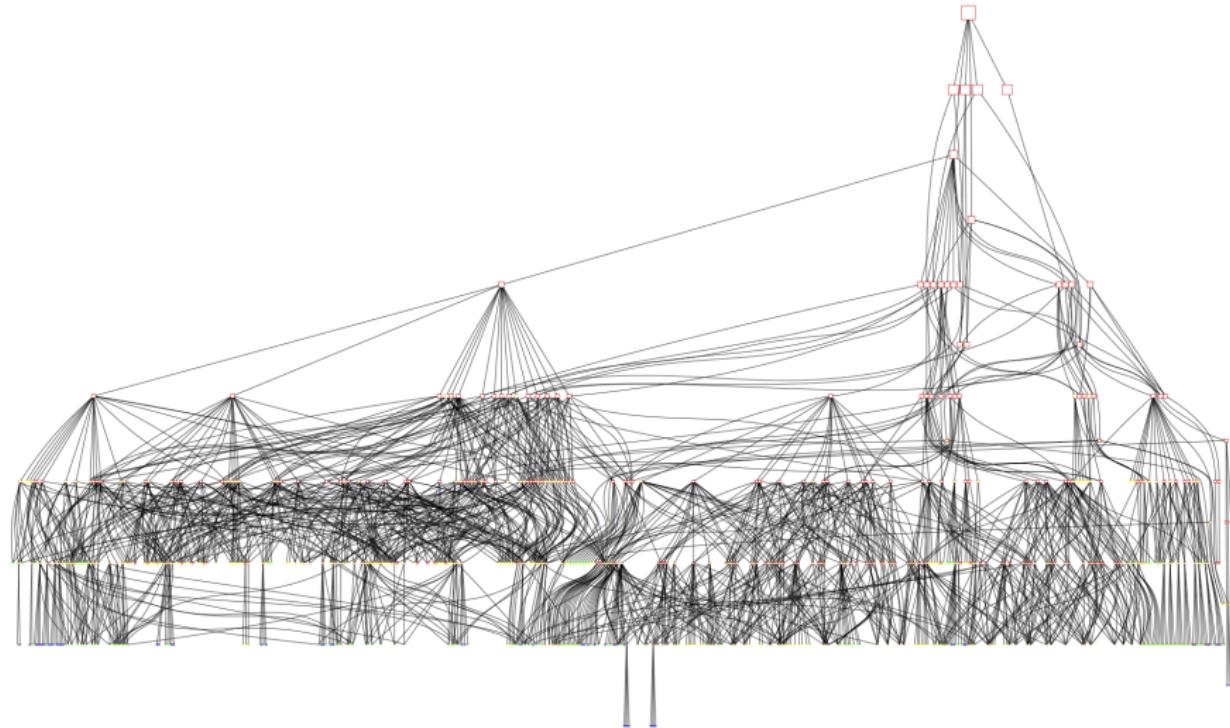

For $\ell = 2, 3, 5, 7, 11, 13$ there are 1208, 47, 23, 15, 2, 11 subgroups $H \leq \mathrm{GL}_2(\widehat{\mathbb{Z}})$ of ℓ -power level with $X_H(\mathbb{Q})$ infinite, and only $H = \mathrm{GL}_2(\widehat{\mathbb{Z}})$ for $\ell > 13$.

This allows us to compute explicit upper bounds on the level and index of arithmetically maximal subgroup of prime power level ℓ and we can then exhaustively enumerate them.

Subgroups of $GL_2(\mathbb{Z}_{13})$

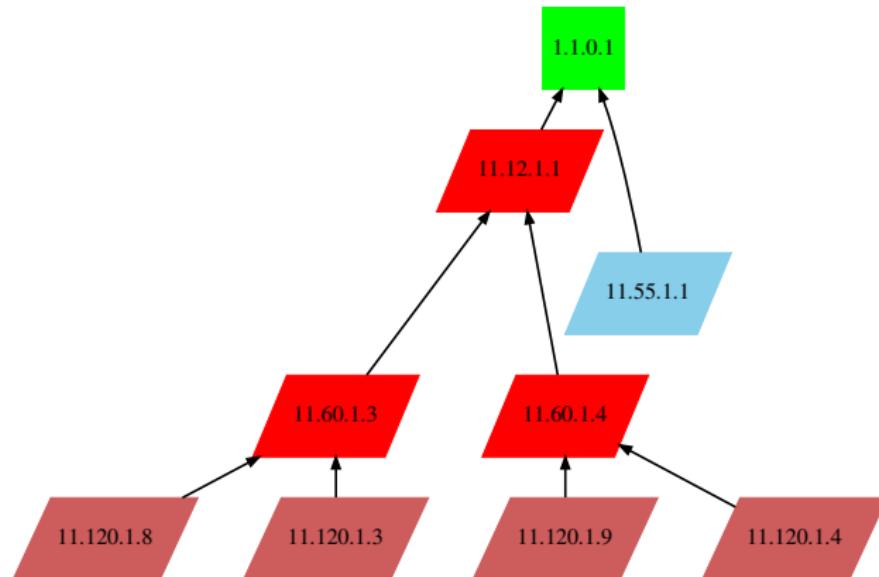

Subgroups of $GL_2(\mathbb{Z}_2)$

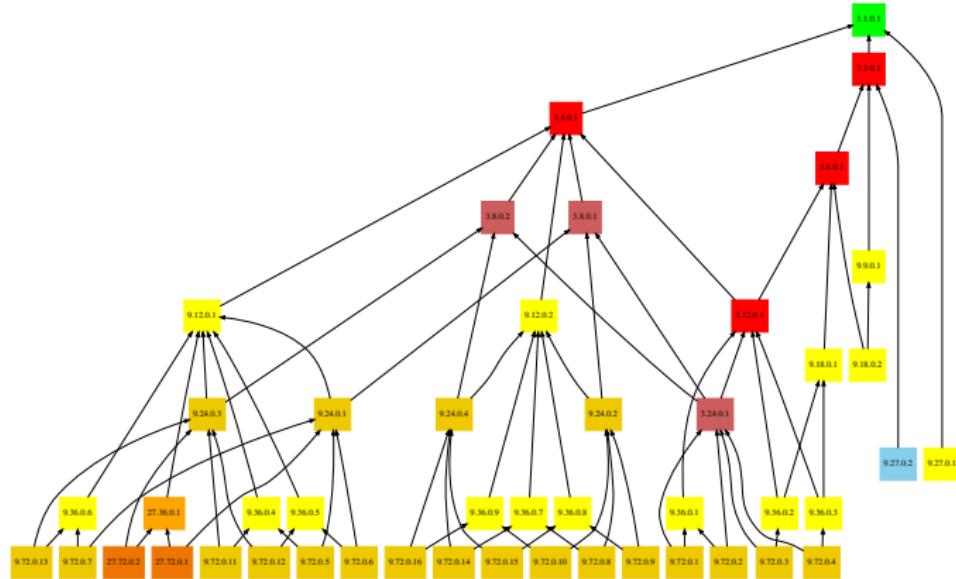

Steps of the proof

- ① Compute the set \mathcal{S} of **arithmetically maximal** subgroups of ℓ -power level for $\ell \leq 37$ (for all $\ell > 37$ we already know $N_{\text{ns}}(\ell)$ is the only possible exceptional group).
- ② For $H \in \mathcal{S}$ check for **local obstructions** and compute the **isogeny decomposition** of the Jacobian of X_H and the analytic ranks of all its simple factors.
- ③ For $H \in \mathcal{S}$ **compute equations** for X_H and $j_H: X_H \rightarrow X(1)$ (if needed). In several cases we can prove $X_H(\mathbb{Q})$ is empty without a model for X_H .
- ④ For $H \in \mathcal{S}$ with $-I \in H$ **determine the rational points** in $X_H(\mathbb{Q})$ (if possible). In several cases we are able to exploit recent progress by others ($\ell = 13$ for example).
- ⑤ For $H \in \mathcal{S}$ with $-I \notin H$ **compute equations** for the universal curve $\mathcal{E} \rightarrow U$, where $U \subseteq X_H$ is the locus with $j(P) \neq 0, 1728, \infty$.

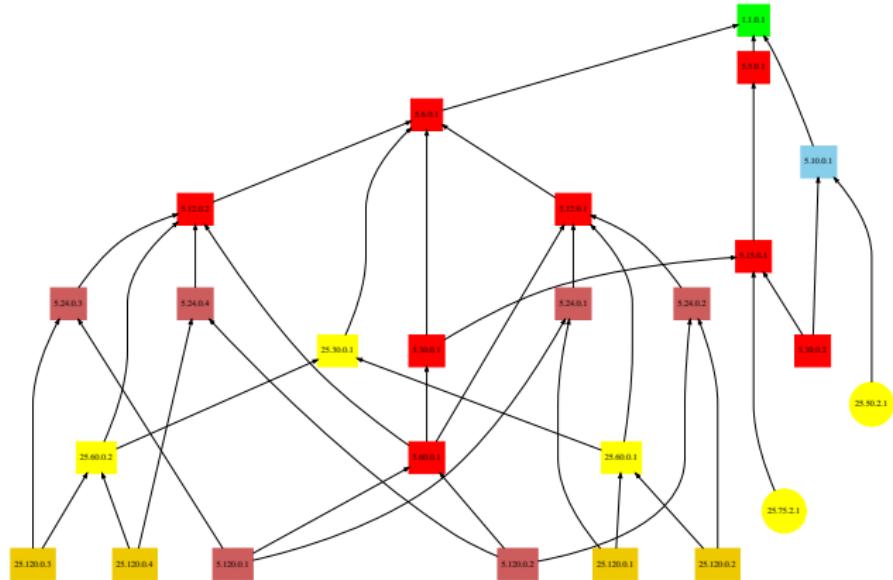

Subgroups of $\mathrm{GL}_2(\mathbb{Z}_{11})$

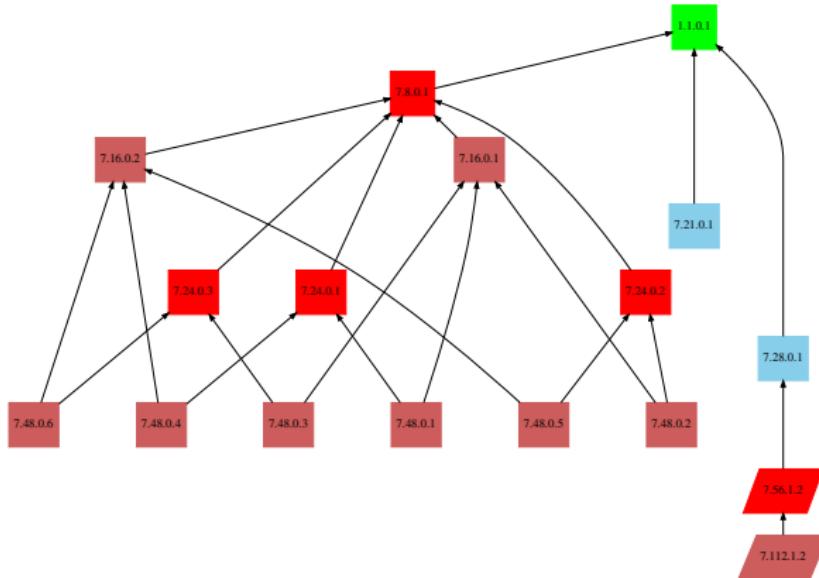

Subgroups of $\mathrm{GL}_2(\mathbb{Z}_3)$

Subgroups of $\mathrm{GL}_2(\mathbb{Z}_5)$

Subgroups of $\mathrm{GL}_2(\mathbb{Z}_7)$

Finding Equations for X_H – Basic idea

- ① The canonical map $C \hookrightarrow \mathbb{P}^{g-1}$ is given by $P \mapsto [\omega_1(P) : \cdots : \omega_g(P)]$.
- ② For a general curve, this is an embedding, and the relations are quadratic.
- ③ For a modular curve,

$$M_k(H) \cong H^0(X_H, \Omega^1(\Delta)^{\otimes k/2})$$

given by

$$f(z) \mapsto f(z) dz^{\otimes k/2}.$$

Equations – Example: $X_1(17) \subset \mathbb{P}^4$

Cusp forms

$$q - 11q^5 + 10q^7 + O(q^8)$$

$$q^2 - 7q^5 + 6q^7 + O(q^8)$$

$$q^3 - 4q^5 + 2q^7 + O(q^8)$$

$$q^4 - 2q^5 + O(q^8)$$

$$q^6 - 3q^7 + O(q^8)$$

$$xu + 2xv - yz + yu - 3yv + z^2 - 4zu + 2u^2 + v^2 = 0$$

$$xu + xv - yz + yu - 2yv + z^2 - 3zu + 2uv = 0$$

$$2xz - 3xu + xv - 2y^2 + 3yz + 7yu - 4yv - 5z^2 - 3zu + 4zv = 0$$

Computing models of modular curves

- We introduce a variety of improvements and tricks to compute models of various X_H .
- The **LMFDB** often has equations for X_H and its j -map.
- See Rouse's [VaNTAGe talk](#) for details and examples.
- We used this method to compute canonical models for many curves of large genus.
- See Assaf's [recent paper](#) and Zywina's [BIRS talk](#) for other efficient approaches.
- A current student of Zywina has recently massively improved all of these algorithms.

Computing $X_H(\mathbb{F}_p)$ “via moduli”

Enumeration

One can compute $\#X_1(N)(\mathbb{F}_{p^n})$ by enumerating elliptic curves over \mathbb{F}_{p^n} , then computing their N torsion subgroups.

Computing $X_H(\mathbb{F}_p)$ “via moduli”

Enumeration

One can compute $\#X_1(N)(\mathbb{F}_{p^n})$ by enumerating elliptic curves over \mathbb{F}_{p^n} , then computing their N torsion subgroups.

Deligne–Rapoport 1973

The **modular curves** X_H and Y_H are coarse spaces for the stacks \mathcal{M}_H and \mathcal{M}_H^0 that parameterize elliptic curves E with **H -level structure**, by which we mean an equivalence class $[\iota]_H$ of isomorphisms $\iota: E[N] \rightarrow \mathbb{Z}(N)^2$, where $\iota \sim \iota'$ if $\iota = h \circ \iota'$ for some $h \in H$.

See Drew’s **Slides** for a nice summary of the implementation.

Arithmetically maximal H of ℓ -power level for which
 $X_H(\mathbb{F}_p) = \emptyset$ for some $p \neq \ell \leq 37$

Decomposing the Jacobian of X_H

Let H be an open subgroup of $\mathrm{GL}_2(\widehat{\mathbb{Z}})$ of level N .

Let J_H denote the Jacobian of X_H .

Theorem (Rouse–Sutherland–Voight–ZB 2021)

Each **simple factor** A of J_H is **isogenous** to A_f for a weight-2 eigenform f on $\Gamma_0(N^2) \cap \Gamma_1(N)$.

Corollary (Kolyvagin's theorem)

If A is an **isogeny factor** of X_H , and if the **analytic rank** of A is **zero**, then $A(\mathbb{Q})$ is finite.

Corollary (Decomposition)

We can **decompose** J_H up to isogeny using linear algebra and point-counting.

Mordell–Weil sieve

- Let X be a **curve** and A be an **abelian variety**.

$$\begin{array}{ccc} X(\mathbb{Q}) \\ \downarrow \\ X(\mathbb{F}_p) \end{array}$$

- If $X(\mathbb{F}_p)$ is **empty** for some p then $X(\mathbb{Q})$ is **empty**.

Mordell–Weil sieve

- Let X be a **curve** and A be an **abelian variety**.

$$\begin{array}{ccc} X(\mathbb{Q}) & \longrightarrow & A(\mathbb{Q}) \\ \downarrow & & \downarrow \beta \\ X(\mathbb{F}_p) & \xrightarrow{\pi} & A(\mathbb{F}_p). \end{array}$$

- If $X(\mathbb{F}_p)$ is **empty** for some p then $X(\mathbb{Q})$ is **empty**.
- If $\text{im } \pi \cap \text{im } \beta$ is **empty** then $X(\mathbb{Q})$ is **empty**.

Mordell–Weil sieve

- Let X be a **curve** and A be an **abelian variety**.

$$\begin{array}{ccc} X(\mathbb{Q}) & \longrightarrow & A(\mathbb{Q}) \\ \downarrow & & \downarrow \beta \\ \prod_{p \in S} X(\mathbb{F}_p) & \xrightarrow{\pi_S} & \prod_{p \in S} A(\mathbb{F}_p). \end{array}$$

- If $X(\mathbb{F}_p)$ is **empty** for some p then $X(\mathbb{Q})$ is **empty**.
- If $\text{im } \pi \cap \text{im } \beta$ is **empty** then $X(\mathbb{Q})$ is **empty**.
- This is explicit and is implemented in Magma.

An equationless sieve for the group 121.605.41.1

The curve X_H has **local points everywhere**, and analytic **rank = genus = 41**.

$H(11) \subset N_{\text{ns}}(11)$, so X_H maps to $X_{\text{ns}}^+(11)$, which is an elliptic curve of rank 1.

$$\begin{array}{ccc} X_H(\mathbb{Q}) & \longrightarrow & X_{\text{ns}}^+(11)(\mathbb{Q}) \\ \downarrow & & \downarrow \beta \\ \prod_{p \in S} X_H(\mathbb{F}_p) & \xrightarrow{\pi_S} & \prod_{p \in S} X_{\text{ns}}^+(11)(\mathbb{F}_p) \end{array}$$

We can compute $\text{im } \pi_S$ without *equations* for X_H or π_S

- A point of $X_{\text{ns}}^+(11)(\mathbb{F}_p)$ corresponds to E with $\rho_{E,11}(G_{\mathbb{F}_p}) \subset N_{\text{ns}}(11)$ and lifts to a point of $X_H(\mathbb{F}_p)$ if and only if $\rho_{E,121}(G_{\mathbb{F}_p}) \subset H(121)$.
- For $p = 13$ the image of any point in $X_H(\mathbb{Q})$ maps to nR with $n \equiv 1, 5 \pmod{7}$.
- For $p = 307$ any point in $X_H(\mathbb{Q})$ maps to nR with $n \equiv 2, 3, 4, 7, 10, 13 \pmod{14}$.
- Therefore $X_H(\mathbb{Q}) = \emptyset$ (and in fact $X_H(\mathbb{Q}) = \emptyset$; there are no rational cusps).

Gargantuan models of modular curves¹

- We computed canonical models (over \mathbb{Q}) for $27 \cdot 729 \cdot 43 \cdot 1$ (resp. $25 \cdot 625 \cdot 36 \cdot 1$).
- We use these models to prove that X_H has no \mathbb{Q}_3 (resp. \mathbb{Q}_5) as follows.
- These models have very bad reduction at $p = 3$ (resp. 5). (They're not even flat.)
- $X_H(\mathbb{F}_p) \neq \emptyset$ for all p , but $X_H(\mathbb{Z}/p^2\mathbb{Z}) = \emptyset$ for $p = 3$ (resp. 5).
- The “Greenberg transform” (i.e., the “Wittferential tangent space” of Buium) is adjoint to Witt vectors: $X_H^{(1)}(\mathbb{F}_p) = X_H(\mathbb{Z}/p^2\mathbb{Z})$.
- The fibers of the map $X_H^{(1)} \rightarrow X_H$ have no \mathbb{F}_p points.
